EXPERIENCE

Postdoctoral researcher — July 2021 - Present
Australian Institute for Machine Learning — *South Australia, Australia*

- Project: *Domain adaptation for maritime situational awareness* with Safran.
  - Develop a weakly supervised test-time domain adaptation for Faster-RCNN, effectively mitigating the domain disparity between simulated and real images, including visible and infrared modalities captured by Safran's Vigy Observer.
  - Develop a "when to adapt" method for RetinaNet, saving 50%-90% energy usage for continual domain adaptation without sacrificing the overall performance of the object detection.
  - Develop a GenAI method for infrared-to-visible video translation, achieving a significant improvement in day-to-night YOLOv5 object detection accuracy.
- Project: *Edge domain adaptation* with SmartSat CRC.
  - Develop a bandwidth-efficient model update method, achieving domain adaptation by updating only 1% of CNN ResNet50's weights.
  - Our method has been ***implemented in Kanyini***—the first satellite fully designed, built, and owned by South Australia..
- Project: *Neuromorphic computing for combinatorial optimization* with Intel Labs.
  - Develop a novel spiking neural network formulation for hypergraph minimum vertex cover.
  - Our method, ***tested on Intel's Loihi2 neuromorphic chip***, achieves high-quality solutions with significantly lower energy consumption than CPU-based solvers.
- Project: *Quantum robust fitting*.
  - Develop a hybrid quantum-classical combinatorial optimization method for robust fitting
  - Our algorithm, ***tested on the D-Wave Advantage quantum machine***, offers a global solution or an error bound with sub-linear time complexity, that enables efficient scalability.
